

Creating SSH Keys for rsync or ssh etc.

Create keys on local machine

```
ssh-keygen -t dsa
```

Copy Public Key (id_dsa.pub) to PC you want to log into

```
scp ~/.ssh/id_dsa.pub username@host:
```

On the PC you want to log into go to the .ssh folder in the home dir and add the key in to the authorised keys file

```
cat id_dsa.pub >> authorized_keys
```

Thats it. The pub key can be deleted off the server. Job Done.
